Want your work to keep moving? Give Codex one real mission.

Today: connect the project, map the work, speak the task and approve the first batch.

You keep judgment and approval.

You are the mission owner.

Codex is the suit.

You provide the mission, judgment, creativity, responsibility and approvals.

Codex researches, plans, creates, checks, documents and continues approved work.

You leave with your suit working.

1

Your project opens

Company account, correct project and startup test passed.

2

Your work becomes visible

Approved folders, Drive files and delegation rows become one inventory.

3

One mission starts

Codex recommends one real task and a bounded first batch.

Ambuj runs the group. The Setup Helper handles the machinery.

Codex can help close your own assigned list.

Rohan

Locked rollout snapshot. Trusha: 2. Shadab also has 51 Shopify tasks on the specialist sheet.

Choose the task. Codex works. Proof closes it.

No invented exercises. Start from work already assigned to you.

Two Shopify stores. Four days. One person.

82

verified line items

200+

discrete actions

4

days

2

stores

Zero money spent without approval. Every change has proof.

Abilash ran this himself. The rollout exists so each employee can apply the pattern to their own work.

The operating files ended repeated cold starts.

109,771

tokens before

1,967

tokens after

$\approx 56\times$

reduction

5

common files

Measured with the o200k_base tokenizer after the restructure.

The files remember operating state, so a new session does not start from zero.

Three things keep wasting our time.

Work is scattered

Drive, local folders and delegation rows are not yet one map.

Decisions repeat

The answer sits in memory or an old chat, so the same question returns.

Done has no proof

A change is called complete before the result is checked.

First make the work visible. Then let Codex act inside approved boundaries.

One recorded fact ended the repeated question.

The question returned

Four references to one campus kept reappearing in new chats.

The fact was locked

One authoritative answer moved from memory into shared context.

Contradictions now stop

New evidence can reopen the decision; repetition cannot.

Write the decision once. Future sessions spend time on the next real task.

From 1× toward 800× capability.

Not 800× more typing. More approved work completed through repeatable workers.

AMBITION ONLY · NOT ACHIEVED OR GUARANTEED

We will measure completed work, time, proof and errors—not slogans.

Do you want a system like this?

Watch one minute. Then see how Kairali makes it controlled and repeatable.

LET ME SHOW YOU HOW · PLAY 00:40–01:40

[PLAY THE 60-SECOND DEMONSTRATION](#)

Mission → work → proof → next ruling.

Codex continues only inside the task, sources, tools and permissions you approved.

THE HUMAN RULES · THE SUIT EXECUTES

Stop for access, publishing, deletion, security, Gate 0 or any new authority.

Five files hold the work. Three rules hold the line.

CURSOR

EVIDENCE

proof attached

ONE

task at a time

≤ 25

per batch

PROOF

or not done

Separate state per worker. Shared facts stay read-only.

These files make autonomy resumable.

One worker, one live task. A supervisor reports drift; it does not silently rewrite.

Evidence, locked facts and Gate 0 prevent drift.

Evidence proves done

Before, after and undo. A saved setting is not proof.

Locked facts stop loops

One owned source. New evidence may reopen it; repetition may not.

Gate 0 stops

Medical, dosage, certification, legal and spend are flagged—never fixed.

Autonomy ends wherever human judgment or new authority begins.

Do not troubleshoot the machinery yourself.

1

Open ChatGPT or chatgpt.com.

Start a blank chat with the approved company account.

2

Use the complete Setup Helper card.

Paste the full message exactly. Do not shorten it.

3

Follow one visible action at a time.

The helper checks, acts and verifies. You do only the login, account choice or permission it cannot.

```
I am stuck setting up my Kairali AI workspace.  
Be my Setup Helper.
```

Done when the helper checks what is already installed and names only the next visible action.

One public kit opens the right work.

1

Start with the protected v1.1 release.

The Setup Helper gets the all-in-one Kairali kit. No invitation or Git knowledge needed.

2

Keep each worker separate.

Named private operations: GitHub Desktop. Homework or Sheet/local work: a separate local worker from the kit.

Done when AGENTS.md is visible and Codex reads the correct separate project.

Upgrades happen only at a safe checkpoint. Managed system files update; employee state stays.

Connect approved Gmail and Google Drive Apps.

1

Open Settings → Apps.

The helper searches for the approved company App. If Apps is disabled, it records the workspace blocker.

2

Connect approved Gmail.

You choose the company Google account and read the requested access before approving.

3

Connect approved Google Drive.

Start a new Codex task after both Apps are connected.

Confirm Gmail and Google Drive are connected. Name one approved company item from each. Change nothing.

Done when Codex names one approved company item from each App.

Give access only where the work lives.

ON A MAC

The helper opens System Settings. You approve one requested ChatGPT permission.

```
COMPANY PROJECT + ASK FOR APPROVAL
```

ON WINDOWS

The helper keeps the company folder and target app visible. You approve one named target.

```
COMPANY PROJECT + VISIBLE TARGET APP
```

Below the prompt, keep permissions on Ask for approval.

```
Approve only the company folder, app or website you understand.
```

Done when Codex reads the project and asks before leaving the approved scope.

Never treat tool availability as permission.

Let the helper prepare Wispr Flow.

ON A MAC

The helper checks Applications first. If missing, it opens the official download.

ON WINDOWS

The helper checks Start first. If missing, it opens the official download.

You use the company-approved sign-in choice shown by Ambuj.

Approve Microphone and Accessibility only when the selected feature requests them.

Done when one short spoken sentence appears correctly in a safe text box.

Never dictate passwords, one-time codes, private HR, banking or Gate 0 content.

Speak. Review. Then send.

1

Click inside the Codex message box.

Make sure the cursor is blinking where the words should appear.

2

Use the Wispr shortcut shown in its tutorial.

Say the mission slowly. Stop speaking when finished.

3

Read the transcript before sending.

Fix names, numbers and task IDs. Then press Return.

```
Read AGENTS.md and MASTER_CURSOR.md. Tell me the one live task, or say NOT SET. Change nothing.
```

You speak the mission. Codex executes only after you send and inside the approved task.

Put ChatGPT on your phone. Pair Remote.

1

Let the helper confirm the official mobile app.

Use the App Store or Google Play. Install ChatGPT by OpenAI and sign in to the same company workspace.

2

Pair the computer.

The helper opens Settings → Connections → Control this Mac or PC. You approve and scan the QR code with the phone.

Done when Remote on the phone shows this computer and opens a safe task.

Keep the computer awake and online, with ChatGPT/Codex running. Availability may depend on company settings.

Reach your work computer from home.

1 · Set up on the work computer

Ask Ambuj/IT. Open Chrome → remotedesktop.google.com/access → Download → install → create a private PIN.

2 · Leave it ready before going home

Keep the work computer powered on, awake and online. Lock the screen; never share the PIN.

3 · Connect from the home computer

Open the same address in Chrome → sign in to the approved company Google account → choose the computer → enter the PIN.

OPTIONAL · Full remote control. Use only with company approval. Disconnect when finished. A dimmed computer is offline or unavailable.

Approve work areas. Exclude personal data.

Include company work only

Approved local work folders and approved Drive locations.

Exclude sensitive areas

Personal folders, passwords, HR, banking and private records.

Gate 0 stops here

Medical, dosage, certification, legal and spend material is flagged—not inventoried or fixed.

Read-only means: no rename, move, delete, edit, upload or sharing changes.

One scan. Two files. One shared Sheet.

JSONL

AI-readable inventory

CSV

human-readable
inventory

**GOOGLE
SHEET**

shared human copy

25

items per batch

PROMPT · INVENTORY APPROVED LOCATIONS

Inventory only the approved company locations in batches of 25. Record source, path or link, name, type, owner, modified date and category. Save data-inventory.jsonl and data-inventory.csv. Create a Google Sheet named My Work Inventory. Change nothing else.

The scan starts. Then Codex recommends one real mission.

Employee

Approves locations, reviews Codex's recommendation and approves the ruled task.

Codex

Reads the inventory and delegation. Sorts: autonomous, needs review, or blocked.

Ambuj

Runs the group, troubleshoots access and keeps everyone on the same step.

PROMPT: Read my delegation rows and My Work Inventory. Recommend one task ID and a first batch of no more than 25. Change nothing yet.

Setup Helper handles machinery. Abilash rules owner and Gate 0 decisions.

Build two workers. Bring both reports.

EMAIL

At most 25 messages → EMAIL-TRIAGE-REPORT.md. No send, delete, move or attachment open.

DRIVE

At most 25 metadata rows → DRIVE-INVENTORY.md. No file opened or changed.

OPTIONAL

LinkedIn draft from supplied facts only. DRAFT - NOT PUBLISHED. Never open LinkedIn.
